## DETAILED ACTION

### *Continued Examination Under 37 CFR 1.114*

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on May 2, 2003 has been entered.

### *Response to Arguments*

2. Applicant's arguments with respect to claims 4-6,9 and 10 have been considered but are moot in view of the new ground(s) of rejection.

### *Claim Rejections - 35 USC § 102*

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

4. Claims 4-6, 9 and 10 are rejected under 35 U.S.C. 102(e) as being anticipated by Chen et al (US 6,304,608) in view of Heikkilä et al (US 5,805,093). This is a multiple Reference 35 U.S.C. 102 Rejections. See MPEP 2131.01.

Art Unit: 2634

Consider claims 4,6 and 9 first. Referring to Fig. 2, Chen et al discloses a sigma delta modulator, comprising an input circuit/summing circuit (21) for receiving an input ( $V_{in}$ ) and a feedback signal and providing a difference signal, a filter circuit (22), a quantizer circuit (25), a feedback circuit (26,27), wherein the input circuit includes an amplifying means ( $g_1$ ) for amplifying the difference signal. Regarding a sampling capacitor and switch in the filter recited in the claims, Heikkilä et al shows that a sampling capacitor and switch, a characteristic not disclosed in the Chen et al reference, is inherent in an integrator used in the analog to digital conversion system. See Fig.2. The claims further limit that the amplifier serves “to reduce the input-referred thermal noise by a factor of approximately the gain.” However, no specifics about the amplifier are recited that allows the stated function. In this light, the amplifier ( $g_1$ ) in the sigma delta modulator of Chen et al is considered to reduce the input-referred thermal noise by a factor of approximately the gain because it is presumed that the identically disclosed amplifier must have same effects.

Regarding claims 5 and 10, see col.11, line 53 teaching the amplifier gain ( $g_1$ ) greater than one.
